Android devices already get regular security updates. And in Android 10, you'll get them even faster and easier. With Google Play system updates, important Security and Privacy fixes can now be sent directly to your phone from Google Play, just the same way all your other apps update. So you get these fixes as soon as they are available. 780 Montague Expressway, Suite 308 San Jose, CA 95131 USA | Tel: +1 408 412 8645 To develop an app using Google Play services APIs, follow the instructions on this page to set up your project with the relevant SDKs, which are available from the Google maven repository. To test your app when using Google Play services, you must use one of the following: A compatible Android device that runs Android 4.4 (API level 19) or higher and has the Google Play Store app installed. The Android emulator with an AVD that runs the Google APIs platform based on Android 4.4 (API level 19) or higher. Declare dependencies for Google Play services To develop features that depend on the Google Play services APIs in your app, complete the following steps: The following snippet shows an example build.gradle file that uses the location library: apply plugin: 'com.android.application' ... dependencies { implementation 'com.google.android.gms:play-services-location:20.0.0' } New versions of the Google Play services SDKs with bug fixes and new features are periodically released. These updates are announced in the release notes. If your app uses a dependency that has been updated, change to the latest version in your app's dependencies to take advantage of these fixes. Note: To preserve the required classes, the Google Play services SDKs each include directives that instruct R8 on how to optimize your app. Check whether Google Play services is installed As described in the Google Play services overview, Google Play services receives automatic updates on Android 4.4 (API level 19) and higher through the Google Play Store app. However, Android devices without Google Play Store don't have Google Play services installed. If your app runs on devices without Google Play services, you might want to check to see if Google Play services is installed on the device before you attempt to use Google APIs, or enable features in your app that require Google Play services to function. To check for the presence of Google Play services on the device, use the isGooglePlayServicesAvailable() method. To then begin a connection to Google Play services, or learn how to detect whether the version of Google Play services installed supports a specific API, read the guide on Accessing Google APIs. Google Play services dependencies The following table lists the dependencies for Google Play services that you can include in your Android app. You can filter the list by device type by selecting one of the buttons, and you can search for a specific use case or dependency name by entering text into the box that appears after the buttons. Table 1. Google Play services dependencies to include in Android apps Use case and dependency name Supported devices Google Mobile Ads com.google.android.gms:play-services-ads:21.2.0 Phone, Tablet Android Advertising ID (AAID) com.google.android.gms:play-services-ads-identifier:18.0.1 Phone, Tablet, Android TV, ChromeOS Lightweight version of Google Mobile Ads com.google.android.gms:play-services-ads-lite:21.2.0 Phone, Tablet AdSense for Search (AFS) Custom Search Ads (CSA) com.google.android.gms:play-services-ads-native:19.0.3 Phone, Tablet, ChromeOS Google Analytics Services SDK for Android com.google.android.gms:play-services-analytics:18.0.2 Deprecated.
